FCR, the world's first CR to receive PMA^{*1} approval from FDA^{*2} for mammography.

*1: PMA (Premarket Approval) *2: FDA (U.S. Food and Drug Administration)

Realization of high-resolution digital mammography and pediatric imaging.

The FCR PROTECT ONE is a single-stacker X-ray image reader that follows the path of Fujifilm's high precision FCR PROTECT CS for superb digital mammography. One feature that separates the FCR PROTECT series from other models is Fujifilm's exclusive Dual-Side Reading Technology. The system supports Imaging Plate (IP) such as HR-BD^{*1} and ST-BD^{*2} for optimal mammography and pediatric/neonatal imaging in which higher detectability is demanded. Further, smooth and seamless workflow, as well as superior operability is maintained at all times with this equipment that is also an optional backup for the FCR PROTECT CS.

*1. High-Resolution Dual-Side Imaging Plate *2. Standard Dual-Side Imaging Plate

Dual-Side Reading Technology

The Dual-Side Imaging Plate (IP) Reading technology allows the use of a thicker phosphor layer on the transparent base, thereby increasing DQE (Detective Quantum Efficiency) by collecting the emissions from both sides of the IP.

High-precision Images For Various Needs

Digital Mammographic Imaging

Image quality is consistently high with wide latitude and sharp definition, whether it is for digital mammogram or plain X-ray, and whether on print or on display. Optimized images are the result of up to 20-pixel/mm scanning pitch and combining image-processing algorithms.

Digital Pediatric Imaging

Incredibly high-quality pediatric and neonatal imaging, as well as images of premature infants, are promised by using IP ST-BD. Image graininess is drastically reduced, for clearer and more detailed contrast. The system also delivers clearer images with less exposure dose, and therefore is gentle to the patient, even when the patient has to frequently take many X-rays.

Enhanced Image Processing

"Image Intelligence™" – a set of sophisticated digital image-processing software technologies available through the CR Console – processes image data and optimizes final output.

MFP Multi-frequency Processing*

As an optional software applicable for all types of FCR imaging, MFP is an improved version which uses frequency enhancement to provide more diagnostic data from a single exposure image, using Fujifilm's renowned Dynamic Range Control (DRC). MFP improves visibility of both dense and peripheral tissue by simultaneously applying edge enhancement processing to small and large structures within an image.

PEM Pattern Enhancement Processing for Mammography*

As an optional software specifically developed for mammographic imaging, PEM enhancement processing improves the conspicuity of micro-calcifications.

* Image processing requires the use of FCR CR Console Plus

Optimized Operation

The MAMMOASCENT AWS-c optimizes your mammography examinations with its advanced design and features.

Digital Mammography System

A digital Mammography System is a system that links the FCR PROTECT ONE and/or the FCR PROTECT CS with the SYNAPSE Mammography Viewer via the MAMMOASCENT AWS-c and/or the CR Console to optimize the viewing of any body part that may be associated with breast cancer.
